

Individual Income Tax Returns, 1994: Early Tax Estimates

by Maureen Keenan and Jeffrey B. Curry

Early estimates for Tax Year 1994, based on individual income tax returns filed through April 1995, reveal that both "adjusted gross income" (AGI) and "taxable income" grew at a faster rate between 1993 and 1994 than between 1992 and 1993. AGI increased by 4.0 percent (compared to 2.3 percent for 1993), from \$3,327.8 billion for 1993 to \$3,461.5 billion for 1994. Taxable income increased 4.8 percent (2.2 percent for 1993), from \$2,150.2 billion for 1993 to \$2,252.8 billion for 1994. As a result of these increases, total income tax grew by approximately 5 percent for the second year in a row, reaching \$449.9 billion for 1994.

Of the sources of income, the most noticeable increase for 1994 was in taxable social security benefits which rose by 48.9 percent. This was due to a tax law change which increased the maximum percentage of total benefits subject to the income tax from 50 percent to 85 percent. Salaries and wages, the largest component of income, increased by 3.8 percent to \$2,735.6 billion. In contrast, declines occurred in taxable unemployment compensation and in taxable interest. Taxable unemployment compensation decreased by 31 percent, coinciding with a decline in the 1994 unemployment level. Taxable interest also declined (by 11.5 percent) to \$106.9 billion, despite the fact that interest rates climbed in 1994 (while remaining relatively low compared to other recent years).

Other than sources of income, the most significant change for 1994 was a 36.3 percent increase in earned income credit (EIC), which rose from \$14.6 billion for 1993 to \$19.9 billion for 1994, while the number of claimants grew from 14.3 million to 17.7 million (an increase of more than 24 percent). These increases were largely due to changes in the tax law that expanded the credit to include certain low-income taxpayers with no dependent children and increased the eligibility requirements for families with two or more dependent children.

For 1994, the Internal Revenue Service (IRS) verified the social security numbers (SSN's) reported on income tax returns for dependents, mainly to reduce fraudulent EIC (and other) refund claims. Partly as a result, there was a decline in the number of electronically-filed returns, and the total number of dependent exemptions fell. Also, the number of returns claiming the EIC would have actually fallen about 1.5 percent if the credit had not been expanded for 1994 to include certain taxpayers with no dependent children. This number might have fallen even more if the maximum earned income and AGI to qualify for the EIC were not made higher for taxpayers with two

Tax law changes enabled the "earned income credit" to increase 36 percent to \$19.9 billion. The number of claimants grew 24 percent to 17.7 million.

or more dependent children versus those with one.

Data for this article were derived from the "Early Tax Estimates," or ETE, subset of returns included in the full sample used for *Statistics of Income--Individual Income Tax Returns* for

1994. The ETE sample is designed to provide reliable estimates as soon as possible following the close of the regular tax return filing season. Each return in the ETE sample represents approximately one out of 5,000 returns in the population. In contrast to the estimated 106,000 individual tax returns in the full Individual Statistics of Income (SOI) sample, the size of the 1994 ETE subsample of returns filed through the end of April 1995 was 21,051 returns. While 1994 represents the third time this sample was used for a published report on early tax data, the taxpayers included in the ETE subsample have been part of the Statistics of Income sample each year since Tax Year 1979, provided that they filed a return for the given year.

In order to provide some insight into how the ETE subset of returns filed through April relates to the full-year SOI sample, Figure A compares estimates of key income and other items from both samples for Tax Year 1993. For many items, such as salaries and wages and total earned income credit, the ETE sample of returns provides reliable estimates. For other items, however, the ETE sample provides less reliable estimates. These items include partnership, S Corporation, and sole proprietorship (farm and non-farm) net income or loss; capital gains and losses; and the alternative minimum tax. These items are often reported in sizable but varying amounts on returns filed after April. The returns on which they appear are mainly those for which filing extensions have been taken, and many are for high-income taxpayers. As a result, early tax estimates for these items (and for high-income returns in general) should be used with caution.

A second problem with the estimates from high-income returns is that they are subject to relatively high sampling variability. Since the ETE subset of returns is a simple random sample not stratified to favor high-income taxpayers, there may be an insufficient number of returns filed through April to present an accurate picture of this part of the individual income tax return population. The discussion that follows, therefore, focuses only on those tax return items and those taxpayer characteristics for which the ETE sample is believed to offer the most reliable

Maureen Keenan and Jeffrey B. Curry are economists with the Individual Research Section. This article was prepared under the direction of Carl Greene, Chief.

² Data are based on a stratified random sample of returns filed through December and are published in Statistics of Income--1993, Individual Income Tax Returns (in preparation).

³ Includes earned income credit used to reduce total income tax to zero.

⁴ Includes earned income credit used to reduce total income tax to zero plus the amount used to offset any additional taxes and the refundable portion.

⁵ Total income tax was the sum of income tax after credits and alternative minimum tax, less earned income credit (if the result was negative, total income tax was zero).

estimates. The comparisons of data for Tax Years 1993 and 1994 presented in this article are based on early estimates.

Selected Sources of Income and Statutory Adjustments

"Adjusted gross income" (AGI) grew 4.0 percent for 1994, increasing from \$3,327.8 billion for 1993 to \$3,461.5 billion, while the total number of returns filed increased by only 0.5 percent (Figure B). Salaries and wages, the principal income source, rose 3.8 percent from

\$2,635.3 billion for 1993 to \$2,735.6 billion for 1994. The rate of growth for both AGI and salaries and wages outpaced the 2.6 percent annual rate of inflation for 1994 [1].

The principal components of AGI and "statutory adjustments" to AGI are shown in Tables 2 and 3, respectively. In addition to the increase in salaries and wages, several other sources of income showed major changes from 1993 to 1994 (Figure B). Although the Federal Reserve Board raised interest rates six times in 1994, interest rates still remained relatively low and taxable interest declined 11.5 percent. Tax Year 1994

NOTE: All data are for returns filed through April.

was the fourth consecutive year for which taxable interest decreased. Some of this decline may be associated with the transfer of funds from interest bearing accounts to money markets and mutual funds, where some of the income was reported as capital gain distributions. For 1994, capital gain distributions reported on Form 1040 increased by 14.9 percent [2]. Unemployment compensation dropped 31 percent to \$17.3 billion, and the number of returns reporting unemployment compensation as a source of income also decreased, falling 13.2 percent. The decline in unemployment compensation was related to the national unemployment rate, which fell to 6.1 percent in 1994 from 6.8 percent in 1993 [3].

Taxable social security benefits increased 48.9 percent, mainly due to a change in the tax law which raised the maximum amount of social security benefits which could be included in AGI from 50 to 85 percent (see the 1994 Tax Law Changes for additional information). Taxable pensions and annuities increased as well, rising 4.7 percent to \$183.8 billion.

Statutory adjustments to income, which serve to reduce AGI, grew 3.1 percent for 1994. The deduction for one-half of self-employment tax, the largest of all statutory adjustments, increased 7.7 percent to \$9.0 billion. Some of this increase was a result of a change in the tax law which removed the ceiling on the amount of earnings subject to the hospital insurance tax for Medicare. For 1993, only \$135,000 of a taxpayer's earnings were subject

to the Medicare tax. Of the other statutory adjustments, payments to an Individual Retirement Arrangement (IRA) were down by 3.0 percent to \$7.7 billion. In addition, \$1.1 billion was claimed by taxpayers as a statutory adjustment for 1994 moving expenses. Moving expenses incurred prior to 1994 were taken as an itemized deduction (see below).

Itemized Deductions

The number of taxpayers itemizing deductions and the amount they claimed decreased slightly for 1994 (Figure C). The specific deduction which showed the most dramatic change, moving expenses, decreased by 89.2 percent and was attributed to a change in the tax law. For 1994, current year moving expenses became an adjustment to total income rather than an itemized deduction (see the 1994 Tax Law Changes section of this article). Therefore, the \$369 million in moving expenses reported on 1994 returns as an itemized deduction represent moving expenses incurred in a year before 1994. A tax law change may also have accounted for some of the 2.2 percent decrease in deductions for charitable contributions. Beginning with 1994, taxpayers could claim a deduction for a charitable contribution of \$250 or more only if they had a written acknowledgment of the contribution from the qualifying recipient organization. Additional data on itemized deductions classified by size of adjusted gross income are presented in Table 4.

Moving expenses ⁴	686	3,403	109	369	-89.2

¹ Data are based on the Early Tax Estimates (ETE) subsample of returns used for Statistics of Income—Individual Income Tax Returns.

² Returns with no adjusted gross income are not included in the deduction counts. For this reason, the sum of returns with total itemized deductions after limitation and returns with total standard deduction is less than the total number of returns for all filers.

³ Includes amounts not shown separately below.

⁴ Represents expenses incurred in years prior to 1994, but reported on 1994 returns (see text for additional information).

NOTE: All data are for returns filed through April.

Personal Exemptions

The total number of personal exemptions declined slightly for 1994, falling by 0.7 percent to 212.3 million from 213.7 million for 1993, even though the number of returns reporting exemptions rose by 0.7 percent (Figure D). Both the number of returns claiming dependent exemptions and the number of dependent exemptions decreased. Final IRS statistics for full tax years show that the number of dependent exemptions increased every year between 1989 and 1993 [4]. If maintained in the final tabulation, the decrease in the number of dependent exemptions for 1994 would reverse a 4-year upward trend. This decrease may be the result of increased efforts by the IRS to verify social security numbers reported for dependents [5].

Taxable Income and Total Income Tax

Taxable income grew by 4.8 percent, from \$2,150.2 billion for 1993 to \$2,252.8 billion for 1994 (Figure E). This 4.8 percent increase is higher than the 4.0 percent growth in AGI. A portion of this difference may be attributed to the slight decrease in both itemized deductions and dependent exemptions. Also, part of this difference may be due to the fact that income increased at a slightly faster rate than the inflation adjustment of the width of tax brackets, the size of personal exemptions, and standard deduction amounts. Total income tax grew by 5.0 percent, to \$449.9 billion for 1994 [6].

A comparison of total income tax as a percentage of AGI, by size of AGI for 1993 and 1994, shows that all

Figure D

Comparison of Total and Selected Personal Exemptions, Tax Years 1993 and 1994

[Number of returns and number of exemptions are in thousands]

Item	1993 ETE ¹		1994 ETE ¹		Percentage increase in exemptions
	Number of returns	Number of exemptions	Number of returns	Number of exemptions	
	(1)	(2)	(3)	(4)	(5)
Total personal exemptions ²	97,799	213,738	98,512	212,306	-0.7
Taxpayer exemptions.....	97,799	141,805	98,512	142,291	0.3
Exemptions for dependents.....	39,649	71,933	39,133	70,015	-2.7

¹ Data are based on the Early Tax Estimates (ETE) subsample of returns used for Statistics of Income—Individual Income Tax Returns.

² The number of returns with total personal exemptions does not equal the total number of returns filed because some returns have been filed by a dependent and therefore no exemptions are claimed.

NOTE: All data are for returns filed through April.

Individual Income Tax Returns, 1994: Early Tax Estimates

Figure E

Adjusted Gross Income, Taxable Income, and Total Income Tax, Tax Years 1993 and 1994

[Number of returns is in thousands--money amounts are in millions of dollars]

Item	1993 ETE ¹		1994 ETE ¹		Percentage increase in amount
	Number of returns	Amount	Number of returns	Amount	
	(1)	(2)	(3)	(4)	(5)
Adjusted gross income (less deficit).....	106,769	3,327,848	107,291	3,461,494	4.0
Taxable income.....	84,150	2,150,181	85,300	2,252,831	4.8
Income tax before credits.....	84,091	433,468	85,213	454,999	5.0

Total income tax ³	79,957	428,299	80,428	449,908	5.0
Income tax after credits.....	79,931	427,337	80,418	448,871	5.0
Alternative minimum tax.....	289	962	294	1,037	7.8

¹ Data are based on the Early Tax Estimates (ETE) subsample of returns used for Statistics of Income--Individual Income Tax Returns.

² Includes earned income credit used to offset income tax before credits.

³ The number of returns with total income tax is less than the sum of returns with income tax after credits and returns with alternative minimum tax because some returns reported both. The amount of total income tax is the sum of income tax after credits and alternative minimum tax less earned income credit (if the result was negative, total income tax was zero).

NOTE: All data are for returns filed through April.

AGI-size classes under \$40,000 had the same or lower ratio of tax to AGI as for 1993 (Figure F). The largest reduction between the 2 years occurred in the \$20,000 to \$25,000 AGI-size class, possibly caused by the expansion of the EIC in this class and the resultant decline in tax as a growing number of taxpayers were able to claim the credit.

Earned Income Credit and Other Tax Credits

Tax Year 1994 saw major changes in the earned income credit. First, the tax law was changed so that taxpayers who were age 25 through 64 with no dependent children, and with both "earned income" and AGI less than \$9,000, could claim an EIC. These taxpayers did not have to file a Schedule EIC. Also, for the first time taxpayers were allowed to file their tax returns on Form 1040EZ and still receive the EIC. Previously, recipients of the EIC were limited to filing their tax returns on Form 1040 or Form 1040A. Second, the computation of the credit for taxpayers with eligible dependents was altered so that it was no longer the sum of a basic credit, a health insurance credit, and an extra credit for a child born in that tax year. For 1994, the EIC consisted of an amount that was based on the taxpayer's total "earned income" or AGI and an EIC rate that varied by the number of eligible dependents. Third, the income ceiling for qualifying for the EIC was increased for taxpayers with two (or more) eligible dependents. For previous years, this limit had been the same regardless of the number of eligible dependents the taxpayer had. Starting with Tax Year 1994, taxpayers with at least two eligible dependents could qualify for the EIC

with higher levels of earned income or AGI than could taxpayers with only one eligible dependent. Due to these law changes, the number of returns claiming EIC rose by 24.3 percent, from 14.3 million for 1993 to 17.7 million returns for 1994. The amount of credit claimed increased even more, by 36.3 percent, from \$14.6 billion for 1993 to \$19.9 billion for 1994.

As Figure G shows, had the earned income credit not been expanded to include taxpayers with no eligible dependents, the number of returns with the credit would actually have fallen 1.5 percent to 14.0 million returns. This apparent decline may be attributable to the IRS program to verify the social security numbers of all dependents claimed on tax returns as a means of reducing fraudulent claims [7]. At the same time, the amount of credit claimed on returns with at least one eligible dependent rose by 32.0 percent, to \$19.3 billion. For EIC returns with one eligible dependent, the amount of EIC increased by 23.1 percent (which is similar to previous years' EIC increases). The number of returns with one eligible dependent, however, declined by 4.1 percent. While the number of returns with EIC and with two or more eligible dependents increased slightly (1.9 percent) from 1993, the EIC on these returns increased by 43.4 percent. The increase in the number of returns with two or more eligible dependents (compared with the decrease in returns with one eligible dependent) might be related to 1994 being the first year that the maximum income qualifying for EIC was higher for taxpayers with two or more eligible dependents than for one. The large increase in EIC reported by taxpayers with two or more eligible dependents was mostly due to the much larger differential in the

Individual Income Tax Returns, 1994: Early Tax Estimates

Figure F

Total Income Tax as a Percentage of Adjusted Gross Income (AGI), by Size of AGI, Tax Years 1993 and 1994

Size of adjusted gross income (thousands of dollars)

Notes: Total income tax represents income tax after credits and alternative minimum tax, less total earned income credit (if the result was negative, total income tax was zero). All data are based on returns filed through April.

allowable EIC for returns with one versus two (or more) eligible dependents. For example, for 1993 there was a \$77 difference in the maximum amount of credit between these two types of filers. For 1994, this differential was \$490.

Total tax credits (which includes the EIC to the extent that it could be used to offset income tax before credits) remained relatively unchanged from 1993, falling 0.1 percent to \$6.1 billion for Tax Year 1994 (Figure E) [8].

Filing Patterns and Characteristics of Returns

As of April 28, 1995, when the sampling of tax returns for ETE was completed, 107.3 million taxpayers had filed their individual income tax returns, up 0.5 percent compared to 1993 (Figure H). Even though the number of

returns filed as of the end of April increased slightly compared to 1993, based on IRS projections of the total number of returns expected to be filed for the 1994 tax year, only 92.2 percent of returns had been filed as of the end of April. For the preceding 6 years, returns filed through the end of April ranged between 93.0 and 94.2 percent of all returns filed during the entire IRS processing year [9].

Figure I illustrates that the predominant changes in the types of returns filed for 1994 were the decline in the share of returns filed electronically (which reversed a 6-year upward trend), as well as the reduction in the number of Forms 1040PC, 1994 *U.S. Individual Income Tax Returns 1040PC Format*. For 1994, about 11.7 million taxpayers filed their tax returns electronically, down from

NOTE: All data are for returns filed through April.

the 13.4 million for 1993. This 12.7 percent decline in the number of electronically-filed returns was partially a result of the IRS's revenue-protection strategy. In order to ensure that only taxpayers entitled to refunds received them (and also to check for fraudulent EIC claims), the IRS checked names and matched the social security numbers (SSN's) against Social Security Administration records for all taxpayers and their dependents during the Tax Year 1994 filing season. An electronically-filed return with missing or mismatched SSN's was rejected and did not enter the system unless or until it was corrected and refiled [10]. In addition, the IRS eliminated the direct-deposit indicator for Tax Year 1994. Previously, if a taxpayer was filing electronically and requested that their refund be deposited directly to their bank, the IRS would indicate whether or not the direct-deposit would be honored. Banks used the direct-deposit indicator in

determining whether to grant refund anticipation loans to taxpayers requesting them. Without the direct-deposit indicator, taxpayers filed fewer returns electronically because banks were less willing to grant refund anticipation loans.

Filing of the Form 1040PC, which is an IRS-approved computer printout of only those items for which the taxpayer is providing information, declined 34.9 percent to 2.6 million [11]. This sharp decline in the number of Forms 1040PC filed can partially be accounted for by a change in IRS requirements which increased the size of the legend, a literal description of line items, that accompanies the Form 1040PC. As a result of this requirement, the number of pages associated with the Form 1040PC format increased and caused certain tax preparation firms to decrease their level of participation in the Form 1040PC program, opting instead to utilize alternative filing

methods for their clients. In March, at the request of some tax preparation firms, the IRS modified the legend requirement and decided to allow a smaller legend.

Summary

For Tax Year 1994, both AGI and taxable income grew at a faster rate, 4.0 and 4.8, respectively, than for 1993. These increases resulted in total income tax growing by 5.0 percent to \$449.9 billion. The most noticeable increase in income for 1994 was in taxable social security benefits which rose by 48.9 percent, due to a tax law change. Lower unemployment levels led to a decline in taxable unemployment compensation (31.0 percent). Taxable interest income also declined (11.5 percent), even though interest rates climbed in 1994 (although they remained relatively low compared to other recent years).

Other than sources of income, a major change for 1994 concerned the earned income credit (EIC). The EIC claimed by taxpayers rose 36.3 percent from \$14.6 billion to \$19.9 billion. Changes in the tax law, including the expansion of the EIC to cover certain low-income taxpayers with no dependent children and increasing eligibility requirements for taxpayers with two or more qualifying children, may have been responsible for the increase in returns claiming the EIC, as well as the sharp increase in the credit itself.

Increased efforts by the IRS to verify social security numbers of dependents had several ramifications. First, there was a 12.7 percent decline in the number of

electronically-filed returns which can partially be accounted for by the IRS verification program. Second, the total number of exemptions for dependents fell, dropping to 70.0 million from 71.9 million. Finally, the number of returns claiming the EIC would have actually fallen by 1.5 percent if the credit had not been expanded for 1994 to include certain taxpayers with no dependent children, and may have fallen even more if the maximum earned income and AGI to qualify for the EIC were not made higher for two dependent children families than for one.

1994 Tax Law Changes

Standard deductions, personal exemptions, tax rate bracket boundaries, and the earned income credit are all indexed, as required by Federal tax law, so that they are not eroded by inflation. Without indexing, annual increases in inflation would diminish the real value of these items.

The following is a list of Federal tax law changes and IRS administrative changes that had a major impact on the 1994 Early Tax Estimates presented in this article:

Social Security Benefits.-- Up to 85 percent of a taxpayer's social security or equivalent "tier 1 railroad retirement benefits" could be included in AGI for 1994. This would occur if the taxpayer received other income besides their benefits and their "modified income," as derived from the social security worksheet, exceeded \$44,000 and their filing status was married filing jointly (\$34,000 for all other returns, except for married filing

Individual Income Tax Returns, 1994: Early Tax Estimates

separately taxpayers who lived together at any time in 1994; their income limit was \$0) [12]. If a taxpayer's "modified income" fell between \$32,000 and \$44,000 (\$0 for MFS filers who lived together in 1994, \$25,000 to \$34,000 for all other non-joint filers), up to 50 percent of their social security benefits could be included in AGI. Prior to 1994, 50 percent of social security benefits was the maximum amount that could be included in AGI.

Earned Income Credit.-- Significant changes were made to the earned income credit for Tax Year 1994. Individuals and couples who worked; had less than \$9,000 in both "earned income" and adjusted gross income; did not have a qualifying child; and were age 25 through 64 were eligible for the earned income credit for 1994. These individuals did not need to fill out the Schedule EIC and could file their tax return on Form 1040EZ (or on Form 1040 or Form 1040A), to claim the credit. As for previous years, the maximum earned income credit increased, as did the amount of earned income and AGI an individual could earn and still claim the credit. For one qualifying child the maximum credit was \$2,038, up from the maximum basic credit of \$1,434 for Tax Year 1993 [13]. For two or more qualifying children, the maximum credit increased to \$2,528 from the maximum basic credit of \$1,511 for Tax Year 1993. To be eligible for the credit, a taxpayer's "earned income" and AGI had to be less than \$23,755 with one qualifying child or less than \$25,296 with two or more qualifying children. In addition, the health insurance credit (worth a maximum of \$465) and the extra credit for a child born during the year (worth a maximum of \$388) were rescinded.

Self-Employment Tax.-- For Tax Year 1994, the maximum amount of net earnings subject to the social security tax portion of the self-employment tax was \$60,600, up from \$57,600 the previous year [14]. In addition, *all* net earnings of at least \$433 (\$108 for church employees) were subject to the Medicare tax portion of self-employment tax. For Tax Year 1993, only net earnings up to \$135,000 were subject to the Medicare tax.

Moving Expenses.-- For 1994, taxpayers were permitted to deduct current year qualified moving expenses as a statutory adjustment to their total income in computing AGI. Moving expenses incurred prior to 1994 could only be claimed as an itemized deduction. By removing the current-year moving expenses from itemized deductions and treating them as an adjustment to income, taxpayers who used the standard deduction were able to deduct moving expenses. In addition, in order to deduct moving expenses, a taxpayer's new job must have been at least 50

miles (previously 35) further from his or her former home than the previous job. Also, the following no longer qualified as moving expenses: meals while moving from the old residence to the new residence; travel expenses, meals, and lodging for househunting trips; meals and lodging while occupying temporary quarters in the area of the taxpayer's new job; and qualified residence sale, purchase, and lease expenses.

Standard Deductions.--For Tax Year 1994, the basic standard deduction, and additional standard deduction for age (65 and over) and blindness increased for each filing status. Standard deductions rose to \$3,800; \$5,600; \$6,350; and \$3,175 for a single person, head of household, married persons filing jointly or as a qualifying widow(er), and married persons filing separately, respectively. For comparison, Tax Year 1993 standard deductions were \$3,700; \$5,450; \$6,200; and \$3,100, respectively. Additional standard deductions for the aged and blind rose to \$950 for single and head of household filers, and to \$750 for married persons filing jointly, married persons filing separately, and qualified widow(er)s, up from \$900 and \$700 respectively for 1993. The basic standard deduction claimed by dependent filers did not change for 1994, remaining at \$600.

Itemized Deductions.--As for previous years, itemized deductions were limited for some taxpayers based on their AGI. For Tax Year 1994, the threshold for the limitation increased to \$111,800 of AGI from \$108,450 for all filers except married persons filing separately, for whom it increased from \$54,225 to \$55,900. The limitation did not apply to deductions for medical and dental expenses, "investment interest" expenses, casualty or theft losses, and gambling losses. To arrive at allowable itemized deductions, total itemized deductions were reduced by the smaller of: a) 80 percent of the "non-limited" deductions, or b) 3 percent of the amount in excess of the AGI threshold.

Charitable Contributions.--Beginning with 1994, a charitable contribution of \$250 or more could only be deducted if the taxpayer had a written acknowledgment of the contribution from the qualified recipient organization.

Personal Exemptions.--Like standard and itemized deductions, the amount for personal exemptions also increased for Tax Year 1994. For each qualified exemption, a filer could deduct \$2,450, up from \$2,350 for Tax Year 1993.

Tax brackets.--Tax rates remained the same as 1993 at 15, 28, 31, 36, and 39.6 percents while the tax bracket boundaries increased because of inflation indexing (Figure J).

Data Sources and Limitations

The statistics presented in this article were derived from a sample of all individual tax returns received in the ten IRS service center mailrooms from January 1, 1995, through April 28, 1995. The sample was selected based on the primary social security number (SSN) (i.e., the SSN of the "primary" or first listed taxpayer in the case of joint returns) ending in one of two pre-defined orders of the last four digits. Two numbers between 0000 and 9999 were chosen, and all return SSN's ending in one of these two numbers were sampled. Electronically-filed returns with a primary SSN ending in one of these two four-digit combinations were also included in the sample. The same SSN endings have been used every year since 1979. This method of sampling provides the same results as a random sample. The returns studied for the ETE statistics are a subset of the returns included in the sample used for *Statistics of Income -- 1994, Individual Income Tax Returns*.

Since two SSN endings out of a possible 10,000 were selected, each return represented one out of 5,000 returns in the population. The size of the entire ETE sample from January 1 through the end of April was 21,051 returns. Weights were adjusted for returns identified as missing from the sample.

Because the data presented in this article are estimates

based on a sample, they are subject to sampling (as well as non-sampling) error. Non-sampling error may be higher for ETE data than for other SOI data because approximately 20 to 25 percent of the returns included had not yet been subjected to any of the regular IRS return processing steps, which would have corrected many taxpayer reporting errors. Such returns show a tax due at time of filing and are typically processed after April 15th, to permit refund returns to be given priority. Sample returns with tax due were identified when they were received at the IRS centers and forwarded for SOI processing prior to regular IRS processing. During SOI processing these returns were tested for internal consistency, and the more obvious taxpayer omissions and math errors were corrected.

If statistical data are to be used properly, the magnitude of the sampling error must be known. Coefficients of variation (CV's), computed from the sample, are used to measure the magnitude of the sampling error. Estimated CV's for the number of returns and money amounts for selected income items are presented in Figure K. The reliability of estimates based on samples, and the use of coefficients of variation for evaluating the precision of estimates based on samples, are discussed in the appendix to this issue of the *Bulletin*.

Notes and References

- [1] *Economic Report of the President*, 1995, p. 341. The consumer price index (CPI-U) represents annual averages of monthly figures and reflects buying patterns of all urban consumers:

1994 CPI-U = 148.2;

1993 CPI-U = 144.5;

1992 CPI-U = 140.3.

- [2] Early tax estimates for capital gain distributions reported on Schedule D have not been tabulated. Final SOI data show that capital gain distributions reported on Schedule D increased 68.1 percent between 1992 and 1993, from \$5.6 billion for 1992 to \$9.4 billion for 1993.
- [3] *Economic Report of the President*, 1995, p. 320.
- [4] Internal Revenue Service, *Statistics of Income -- Individual Income Tax Returns*, for 1989 through 1992, Publication 1304.
- [5] Internal Revenue Service, Communications Division Press Release, "NEWS, For Release: 6/8/95," release number IR-95-45.
- [6] Total income tax is the sum of income tax after credits (from which the earned income credit was subtracted) and the alternative minimum tax.
- [7] It is possible, however, that the IRS program which verified social security numbers of all dependents

claimed on tax returns merely delayed some tax returns. Thus, the overall impact on the number of EIC claims for 1994 must await the tabulation of all 1994 returns.

- [8] For SOI tabulations, the earned income credit is divided into three parts: an amount used to offset income tax before credits (limited to the amount needed to reduce income tax after credits to zero); an amount used to offset all other taxes (limited to the amount needed to reduce total tax liability to zero); and a refundable portion.
- [9] Taxpayers could file, without incurring any penalty, after April 17, 1995, if:
- (a) they lived outside the United States and Puerto Rico and their main place of business or military post of duty was outside the United States and Puerto Rico (these taxpayers were permitted an automatic extension to August 15, 1995);
 - (b) they filed a Form 4868 for an automatic extension of the filing deadline, paying the estimated tax balance due with this form (these taxpayers were permitted an automatic extension to August 15, 1995); or
 - (c) they filed a Form 2688 for an additional extension of time to file (these taxpayers were granted an extension of 2 or more additional months, provided that there was a good reason why the previous 4-month extension was inadequate).

¹ Includes returns with adjusted gross deficit.

² Excludes electronically-filed returns and computer-generated returns (Form 1040 PC), shown separately.

* Estimate should be used with caution because of the small number of sample returns on which it is based.

N/A - Not applicable since Form 1040EZ could only be filed by either single persons or married couples filing a joint return.

NOTES: Detail may not add to totals because of rounding. All data are for returns filed through April.

¹ The sum of all sources of income less loss, before reduction by statutory adjustments. Total income minus statutory adjustments equals adjusted gross income.

² Not included in total income or adjusted gross income.

³ Returns with adjusted gross deficit.

⁴ Net capital gain (columns 19-20) excludes capital gain distributions (columns 23-24).

⁵ Includes estate or trust net income not shown separately.

⁶ Less than \$500,000.

⁷ Estimate should be used with caution because of the small number of sample returns on which it is based.

NOTES: Detail may not add to totals because of rounding. All data are for returns filed through April.

¹ For married persons filing separately, itemized deductions could have been limited if adjusted gross income exceeded \$55,900; for all other taxpayers, if adjusted gross income exceeded \$111,800. Total itemized deductions, but not the detailed deductions, are after these limitations.

² Includes deductible points and "investment interest expense" not shown separately.

* Estimate should be used with caution because of the small number of sample returns on which it is based.

NOTES: Detail may not add to totals because of rounding. All data are for returns filed through April.

¹ Includes both the regular standard deduction and any additional standard deduction for age 65 or over or for blindness.

² Includes returns with adjusted gross deficit.

³ Less than \$500,000.

⁴ Includes the credit for prior year minimum tax, the credit for interest on certain home mortgages, and other credits.

⁵ Income tax after credits plus alternative minimum tax.

⁶ Total tax liability is the sum of income tax after credits, plus any additional taxes, e.g., self-employment tax, alternative minimum tax, tax on an Individual Retirement Account (IRA), less all but the refundable portion of the earned income credit.

* Estimate should be used with caution because of the small number of sample returns on which it is based.

NOTES: Detail may not add to totals because of rounding. All data are for returns filed through April.

¹ Excludes electronically-filed returns and computer-generated returns (Form 1040 PC), shown separately.

* Estimate should be used with caution because of the small number of returns on which it is based.

N/A - Not applicable.

NOTES: Detail may not add to totals because of rounding. All data are for returns filed through April. Differences exist between the number of returns with a specific characteristic and the number with a specific schedule in support of the characteristic, e.g., an individual may attach Schedule A for itemized deductions, but use the standard deduction on Form 1040, instead. Therefore, data in this table do not necessarily agree with data in other tables.
